Gideon Cheruiyot

06/03/2020

#Problem Definition: Kira Plastinina is an online retail store available for customers in that wants to know the characteristics of their customers in Russia, Ukraine, Kazakhstan, Belarus, China, Philippines, and Armenia. In detail, the sales and marketing team would like to know the characteristics of the different customer groups. #Data Understanding *The dataset has 10 numerical and 8 categorical features. Administrative, "Administrative Duration", "Informational", "Informational Duration", "Product Related" and "Product Related Duration" represents the number of different types of pages visited by the visitor in that session and total time spent in each of these page categories. The value of the "Bounce Rate" feature for a web page refers to the percentage of visitors who enter the site from that page and then leave ("bounce") without triggering any other requests to the analytics server during that session. The value of the "Exit Rate" feature for a specific web page is calculated as for all pageviews to the page, the percentage that was the last in the session. The "Page Value" feature represents the average value for a web page that a user visited before completing an e-commerce transaction. The "Special Day" feature indicates the closeness of the site visiting time to a specific special day (e.g. Mother's Day, Valentine's Day) in which the sessions are more likely to be finalized with the transaction. The value of this attribute is determined by considering the dynamics of e-commerce such as the duration between the order date and delivery date. For example, for Valentine's day, this value takes a nonzero value between February 2 and February 12, zero before and after this date unless it is close to another special day, and its maximum value of 1 on February 8. The dataset also includes the operating system, browser, region, traffic type, visitor type as returning or new visitor, a Boolean value indicating whether the date of the visit is weekend, and month of the year.* #The appropriateness of the data will be addressed by checking:

- whether the data is accurate?
- whether the dataset is enough to sufficiently address the problem at hand?
- whether the dataset was biased or imbalanced? # Experimental design:
- loading and previewing the dataset, checking datatypes
- Cleaning , checking for outliers
- Conducting exploratory data analysis to find out patterns and relationships
- Communicating the observations and findings
- Drawing conclusion

## Challenging the solution.

#loading the dataset

```
store_df <- read.csv('online_shoppers_intention.csv')
```

```
head(store_df)
```

```

```

The most frequented administartive page was between 1 and 2, and users spent an average of 81 seconds were spent o the administrative page. This can help us understand the estimated pages the users visits to login to the the page before navigating to other pages. There are outliers on the both adminidtarive pages and administrative duration. Extreme outliers could be as a results of users who leave there devices unattended to after login in.

```
par(mfrow=c(3,2))

hist(store_df$ProductRelated , xlab = 'time on ProductRelated', ylab =
'freuency',main = 'frequency against time on ProductRelated')

```

users spent and average of 35 seconds on the informational pages, this could suggest that users are less interested in information and are more aware of what they want or looking for. recommendation\* Curate the information to be more appealing to the users.

```

hist(store_df$PageValues , xlab = 'Page Values', ylab = 'freuency',main =
'frequency against Page Values')
```

The average bounce rate was below 1%, suggesting that users were interested in the page and did not leave without exploring other pages. On the other hand, the mean of the page value was 6, indicating the users make visit but they do not end up making transactions or purchases. Recommendation\* finding out what is hindering the users from making purchases. Reason may range form poor user intereface, less secure payment systems.

p + theme_bw()
```

*Findings There is no relationship between the bounce rates and Revenue. Revenue increases with decrease in the administrative pages and productedRelated pages. Additional most frequented administrative and ProductRelated pages visited did not generate any revenue \*most frequent users were from region 1 and are the users that generated most revenue.*

```
ggplot(data = store_df) +
  geom_point(mapping = aes(x =Month , y= SpecialDay , fill = Revenue,
    colour = Revenue))
```

\* Special days were noticed on the month of February and May. This could be due to Valentines and Mothers day on the respective months.

       label = TRUE,
       label_alpha = TRUE)
```

*Informational and administrative duration are highly correlated, this could suggest redundancy. special days, exit rate and bounce rates have weak positive correlation to page value. Thus the more bounce and exit rates the more likelihood that user will identify what they like or don't like and be able to initiate transactions on the page. Administration and administration duration are have a weak negative correlation to the page value, suggesting that the less time spend on the administration pages the more likely they will transact. Recommendation See how informational page can be merged with the administrative page. \*Makes the administrative pages more user-friendly and easy to navigate.*
